

En enkel rapport om utfyllingsgrad av skjema i NNRR

NNRR

Mai 2026

Bakgrunn/innledning

Denne rapporten tar for seg datakvaliteten i NNRR. Den fokuserer på utfyllingsgrad og ser på følgende problemstillinger:

- Andel besvart av spørsmålene
- Forholdet mellom utfylte pasientskjema og behandlerskjema

NNRR består av fire skjemaer:

- Pasientskjema før behandling - 1a
- Behandlerskjema - 1b
- Pasientskjema 6 mnd etter behandling - 2
- Pasientskjema 12 mnd etter behandling - 3

Skjemaene har felter som i MRS-løsningen er delt inn i følgende datatyper:

- Dato/Tid
- Enum
- Number
- Text
- Bool
- Id (Guid)

De tre NNRR-skjemaene har (ifølge kodebok hentet fra MRS-løsningen) følgende fordeling av datatyper.

Table 1: Antallet felter på NNRR sine skjema etter felttype

	Bool	DateTime	Enum	Number	String
Skjema 1a	50	10	789	31	25
Skjema 1b	92	11	240	14	41
Skjema 2	11	9	382	26	22
Skjema 3	20	7	306	16	21

Denne rapporten fokuserer på tre datatyper, Bool, Enum og Numerisk siden disse utgjør festeparten av feltene. Her følger en kort forklaring til datatypene.

Bool

Dette er boolske variabler (True/False) med default-verdi "False". Avkrysningsboksene er typisk organisert under overskrifter hvor én eller flere kryss forventes satt. Det finnes derfor ingen fasit på hvor mange bokser som skal være avkrysset ved en komplett utfylling.

Enum

Dette er kategoriske variabler hvor ett alternativ velges fra en liste. I de fleste tilfeller er manglende verdier kodet som -1 men i noen tilfeller kodes de med 0. I presentasjon av utfyllingsgrad brukes kun de Enum-variablene som er kodet numerisk i datadumpen, hvilket gjør at en del variabler faller bort fra vurderingen. I tillegg må det presiseres at ikke alle registrerte nødvendigvis skal svare på alle spørsmål. F.eks. finnes det nakkespesifikke verktøy som ikke skal benyttes av de med utelukkende rygg smerter.

Numerisk

Disse variablene er som regel én av tre typer:

- Velg et antall (f.eks. barn) eller tall på en skala (f.eks. smerter fra 0-10).
- Koding for et svaralternativ som skal inngå i beregningen av en score.
- En score eller prosent

Forhold mellom skjema

Denne rapporten benytter data fra pasienter med besøksdato mellom 2025-01-02 og 2025-12-31 samt oppfølging registrert mellom 2025-01-01 og 2025-12-31.

Det er totalt 6419 skjema 1a i utvalget og 6503 skjema 1b. A disse er det 0 pasientskjema som mangler klinikerskjema og 96 klinikerskjema som mangler pasientskjema. Av de 6833 som er aktuelle for 6mnd-oppfølgning i 2025 det 2497 som ikke har oppfølgingsdata. Av de 6704 som er aktuelle for 12mnd-oppfølgning i 2025 det 2721 som ikke har oppfølgingsdata.

Manglende utfyllinger

Avkrysningsvariabler

Denne variabeltypen kan per design ikke være tom så det er umulig å si hva det korrekte antallet avkrysninger er. Tabellen over andelen som ikke har krysset av for variablene under er derfor vanskelig å tolke. Tabellen over hvor mange avkrysninger det er per skjema er kanskje bedre egnet til å avsløre manglende registreringer. Skjema 1a har 50 avkrysningsbokser, mens skjema 1b og skjema 2 har henholdsvis 78 og 11. Hvis bare en svært liten andel er avkrysset på et skjema er det muligens grunn til å være skeptisk til datakvaliteten.
